Efficacy of low-dose lung radiotherapy in the management of COVID-19 patients: a randomised, open-label study. *Br J Radiol*. 2023 Dec;96(1152):20230022.doi: 10.1259/bjr.20230022. Epub 2023 Oct 24. PMID: 37751170; PMCID: PMC10646638.

### Abstract

**Objective:** Evaluate role of low-dose radiotherapy (LDRT) in COVID-19 pneumonia.

**Methods:** Sixty-five patients 40 years or older tested positive for COVID-19 reverse transcriptase-polymerase chain reaction with mild to moderate acute respiratory distress syndrome (ARDS), were randomised 1:1, from 4 June 2021, to either best standard of care (control arm) according to the Indian Council of Medical Research guidelines or a single dose of LDRT (LDRT-0.5Gy) to both lungs along with best standard of care (experimental arm). The primary outcome was either progression to severe disease (PaO<sub>2</sub>/FiO<sub>2</sub> ratio <100 mmHg) within 28 days of randomisation or all-cause mortality at 28 days. If the primary outcome could have been prevented, it was considered "favourable"; if not, it was considered "unfavourable." **Results:** Thirty-three patients were allocated to experimental arm, 32 to control arm. An intention to treat analysis was performed. Unfavourable outcome was seen in 5 (15.2%) patients in experimental arm, vs, 12 (37.5%) patients in control arm, odds of an unfavourable outcome in experimental arm were 0.3, 95% CI 0.09-0.97; two-sided p = 0.04. Four and five patients died in experimental and control arm, respectively. No radiation-induced toxicity was observed.

**Conclusion:** LDRT reduced the number of patients with unfavourable outcome at 28 days. **Advances in knowledge:** One of the few randomised studies showing reduced unfavourable outcome in mild to moderate ARDS COVID-19 patients receiving LDRT. ### ABSTRACT :

A 48-year-old male patient presented with a history of fever, abdominal pain and cough for the preceding 14 days. Abdominal examination revealed tenderness in the right hypochondrium. Radiological features were suggestive of multiple liver abscesses. Ultrasonography-guided percutaneous catheter insertion into the largest measuring abscess was done. Pus culture grew *Burkholderia pseudomallei* spp. The patient was started on intravenous meropenem initially which was changed to IV cefoperazone/sulbactam as per the sensitivity pattern. The patient died on the 16th day of admission due to refractory septic shock. The present case highlights the fact that melioidosis is emerging as an important cause and should be considered in the differential diagnosis in patients presenting with multiple liver abscesses and systemic sepsis.

**Abstract :**

Vertebral osteomyelitis is a rare infection that usually affects an intervertebral disc and adjacent two vertebrae, leading to the narrowing of the space between the two vertebrae. The infection can be acute or chronic, depending on the severity of the onset of the disease. We report the case of a 37-year-old male who presented with complaints of backache, evening rise of temperature and night sweats. Magnetic resonance imaging (MRI) showed altered signal intensity in D10 to L2, with prevertebral and paravertebral soft tissue components. Histopathological examination of image-guided biopsy specimens from this lesion showed features of the chronic nonspecific inflammatory process. Culture from the sample revealed growth of *Pseudomonas* sp. The patient was started on intravenous ceftazidime as per sensitivity pattern which was administered for 6 Wk. The patient improved symptomatically and repeat MRI showed significant resolution of the lesions.

**Keywords:** Intervertebral disc, paravertebral space, vertebral osteomyelitis

**Abstract:** Renal transplant recipients (RTRs) show increased mortality after 1st year of undergoing renal transplantation. Cardiovascular disease (CVD) is the major cause of mortality in these patients. Oxidative stress (OS), inflammation, and endothelial dysfunction (ED) represent a key triad for the onset and progression of atherosclerosis. The present study was undertaken to assess OS, inflammatory biomarkers, and ED as a surrogate marker of atherosclerosis in stable RTRs. **Materials and Methods:** Thirty stable post-RTRs along with 30 healthy individuals as controls were included in the study conducted at a tertiary care teaching hospital in south India. Lipid profile; OS markers; malondialdehyde (MDA), ischemia-modified albumin (IMA), and ferric reducing ability of plasma (FRAP); inflammatory marker high-sensitivity C-reactive protein and interleukin 6 (IL-6); ED markers nitric oxide (NO) and P-selectin were estimated using standard methods. Lipid indices were calculated. Carotid intima-media thickness, two-dimensional echocardiogram, and renal Doppler scans were done. **Results:** No difference in lipid profile was observed between the RTRs and the control groups. RTRs had significantly higher oxidant markers (MDA and IMA), inflammatory marker (IL-6), marker of ED (NO), and lower antioxidant marker (FRAP) ( $P < 0.05$ ) compared to the control group. RTRs had significantly more number of carotid plaques compared to the control group. A positive correlation was observed between number of carotid plaque and OS, ED, and inflammatory markers. **Conclusion:** RTRs have increased CVD risk despite undergoing renal replacement therapy. This can be attributed to the increased OS and inflammation which is seen in these patients.

Assessment of serum microRNA-21 and miRNA-205 as diagnostic markers for stage I and II breast cancer in Indian population. Published: 17-Jul-2023**

#### **Abstract**

**Background:** Current markers(carcinoembryonic antigen [CEA] and carbohydrate antigen 15-3 [CA15-3]) lack sensitivity in diagnosis of breast cancer. The aberrantly expressed circulating miRNAs were shown as diagnostic markers in breast cancer. However, there are very few studies from the Indian population. We studied the diagnostic utility of miRNA-21, miRNA-155 and miRNA-205 compared to CEA and CA15-3 in stage I and II breast cancer patients. **Materials and Methods:** Sixty newly diagnosed women with stage I/II breast cancer and 20 healthy controls were recruited. Expression of circulating miRNAs was studied

using reverse transcription-polymerase chain reaction, whereas CEA and CA 15-3 were analyzed by enzyme-linked immunosorbent assay. Results: miRNA-21 and miRNA-155 were upregulated, miRNA-205 down-regulated ( $P < 0.05$ ) and serum CEA and CA15-3 levels increased in breast cancer patients ( $P < 0.001$ ). Receiver operating characteristic curve analysis showed significant area under curve (AUC) for all markers (0.656 to 0.993;  $P = 0.015$  to  $< 0.001$  versus AUC = 0.656;  $P = 0.018$ ) or miRNA-205 (AUC = 0.733;  $P < 0.001$  versus AUC = 0.700;  $P < 0.001$ ) increased its diagnostic performance. Conclusion: Our study shows miRNA-21 and miRNA-205, are useful as diagnostic markers for breast cancer in the Indian population and combination of these miRNAs with CEA but not with CA 15-3 improved their diagnostic performance. Keywords: Breast cancer, diagnostic markers, India, miRNAs, tumor markers

## Abstract

Background: Oxidative stress, inflammation, and endothelial dysfunction represent a key triad for the development and progression of atherosclerosis. Due to chronic low-grade inflammation in chronic kidney disease (CKD), concentrations of various inflammatory, endothelial, and oxidative stress markers are elevated, increasing the risk of atherosclerosis. The present study was undertaken to compare oxidative stress, inflammation, and endothelial dysfunction in diabetic and nondiabetic CKD pre-dialysis patients. Materials and Methods: This was an observational study on 120 CKD pre-dialysis patients: 60 with diabetes and 60 without diabetes. Markers of oxidative stress were measured in blood – malondialdehyde (MDA), ferric reducing ability of plasma (FRAP), paroxonase-1 (PON-1), ischemia-modified albumin (IMA); inflammation – interleukin-6 (IL-6), high-sensitivity C-reactive protein

(hsCRP); and endothelial dysfunction – nitric oxide (NO), carotid wall intima–media thickness (CIMT). Comparisons between the two groups for continuous variables were made with the Student's unpaired t-test or Mann–Whitney test and for categorical values with  $\chi^2$  -test, as appropriate. Results: MDA, IMA, IL-6, hsCRP, NO, and CIMT were significantly higher, while FRAP and PON-1 were significantly lower in the diabetic group when compared to nondiabetic group ( $P < 0.001$ ). The number of atherosclerotic plaques was also significantly higher in the diabetic group compared to nondiabetic group. Conclusion: Our study showed increased oxidative stress, inflammation, endothelial dysfunction, and atherosclerosis in diabetic CKD pre-dialysis patients when compared to nondiabetic CKD pre-dialysis patients and in late stages when compared to early stages of CKD in both groups, indicating increased cardiovascular risk in late stages and diabetic CKD pre-dialysis patients. Keywords: Atherosclerosis, chronic kidney disease, endothelial dysfunction, inflammation, oxidative stress
